Assignment 1

1. Consider the following initial and final state of an 8-puzzle problem:

2	8	3	1	2	3
1	6	4	8		4
7		5	7	6	5

Initial State

Final State

You are to find the most cost-effective path to reach the final state from the initial state using the A* algorithm. Consider that $g(n)$ = depth of node and $h(n)$ = hamming distance. Draw the search tree that the algorithm generates. In addition, write the values of $g(n)$ and $h(n)$ for each state in that search tree.

2. Consider a maze of size $N \times N$, where horizontal and vertical moves cost 1 and diagonal movements cost $\sqrt{2}$. Let h_1 = Euclidean distance and h_2 = Manhattan distance. [Assume that $N > 1$ and the exit point is at (N, N)]

- Prove that h_2 is not an admissible heuristic for the given scenario.
- Show that, if h_1 is multiplied by 1.2, h_1 will not be an admissible heuristic for the given scenario.

3. Consider the following objective function:

$$E(\theta) = |\theta * \sin(\theta) * \cos(\theta^2)|$$

Find any maximum of $E(\theta)$ using the hill climbing algorithm. Consider that the initial value of θ is 0.7 and the value of θ can be changed by 0.1 at each step.
